

Figure S4. Protective efficacy of antiserum raised to 9GlcNH₂-Stx1B against systemic infection due to *E. coli* strain J. Strain J, a UTI isolate, was injected IP 24 h after IP injection of 200 µl of indicated serum. After 48 h mice were euthanized, livers removed and homogenized and bacterial levels enumerated. Points indicate CFU/gm liver of individual mice, bars represent the medians. P value determined by non-parametric t test. Lower limit of detection, 2 CFU/gm.
